## INTERODUCTION AND ELEMANTRY DEFINITIONS

Dickson (1901, Chapter 12, pp. 260-287) determined all subgroups of  $PSp(2, p)$  and in (1904) he determined all subgroups of  $PSp(4, 3)$ . Mitchell (1914) determined the maximal subgroups of  $PSp(4, p)$  for odd  $p$ . Liskovec (1973) classified the maximal Irreducible  $(p, q)$ - subgroups of  $GL(r, p)$ , where  $q$  and  $r$  are primes and  $q$  is odd. Colon (1977) determined the non - abelian  $q$  - subgroups ( $q$  prime) of  $GL(q, p)$  and the non - abelian 2 - subgroups of  $Sp(2, p)$ . Harada and Yamaki (1979) determined the irreducible subgroup of  $GL(n, 2)$  for  $n \leq 6$ . Kondrat'ev (1985, 1986, and 1987) determined the irreducible subgroups of  $GL(7, 2)$ , the insoluble irreducible subgroups of  $GL(8, 2)$  and  $GL(9, 2)$  and the insoluble primitive subgroups of  $GL(10, 2)$ . In the early 1960 Sims developed an algorithm, based on coset enumeration, which takes as input a group  $G$  given by a finite representation and positive integer  $n$ , and output a list containing a representative of each conjugacy class of subgroups of  $G$  whose index is at most  $n$ . A similar algorithm was developed independently by Schaps (1968). After Kovacs, Neubuser and Newman (unpublished notes) have proposed an algorithm which computing certain maximal subgroups of low index. Now in this paper we will determine the irreducible Soluble Subgroups of  $GL(4, p)$ . For this purpose, we mention some Definitions and elementary notions.

1.1 definition: let  $G, N$  and  $H$  be groups and  $G$  has a normal subgroup  $N$  isomorphic to  $N$  such that  $G/N$  is isomorphic to  $H$ , then we write  $G = N \rtimes H$ . If  $G$  has a subgroup isomorphic to  $H$  which intersects  $N$  trivially then  $G$  is a semidirect product of  $N$  and  $H$ , we denote by  $G = N * H$ .

### Definition

We say that 1.2 Definition: We say that a group  $G$  has a central decomposition  $(H_1, \dots, H_n)$  if

1 - Each  $H_i$  is a normal subgroup of  $G$

2 -  $G = H_1 \dots H_n$ .

3 - For each  $i$  and  $j$ ,  $H_i \cap H_j = Z(H_i) \cap Z(H_j)$

4 - For each  $i$  and  $j$ ,  $H_i \cap H_j = Z(H_i)$  or  $Z(H_j)$

We also say that  $G$  is the central product of  $H_i$  by  $G = H_1 Y \dots Y H_n$ .

### Definition

The holomorph of group  $G$ , denote by  $HOL(G)$ , is the semidirect product of  $G$  and its automorphism group.

## NOTATIONS AND ELEMENTARY RESULTS

In this Section we discuss some necessary results, which needed for later sections to Notations and elementary notions for use of their in after chapter.

### Notation

We use  $Sym(X)$  by means the symmetric group on the set  $X$ , and  $S_n$  to means that the symmetric group on the set of the first  $n$  positive integers. If  $G$  and  $H$  are permutation groups, we denote the wreath product of  $G$  and  $H$  by  $G \wr H$ , where  $G$  is a co-ordinate subgroup and  $H$  is the top group.

### Theorem

(Huppert (1967, Theorem II. 3. 2. p. 159) Let  $p$  be a prime,  $n$  top a positive integer and  $V$  be the vector space of dimension  $n$  over the field of  $p$  elements. If  $G$  is

a subgroup of  $GL(V)$ , denote by  $V * G$  the permutation group of degree  $pn$  which is the semidirect product of  $V$  (acting on itself by translation) and  $G$  (acting in natural way) considered as a subgroup of  $\text{sym}(V)$ . Let  $S$  be a complete and irredundant set of conjugacy class representatives of the irreducible soluble subgroups of  $GL(V)$ .

(a) If  $G \in S$ . Then  $V * G$  is a primitive soluble permutation group of degree  $pn$ .

(b) If  $G \in S$  and  $H$  is a subgroup of  $GL(V)$ , that is conjugate to  $G$ , then  $V * H$  is conjugate in  $\text{sym}(V)$  to  $V * G$ .

(c) If  $G \in S$  and  $H$  is a subgroup of  $GL(V)$ , that is not conjugate to  $G$ , then  $V * H$  is not conjugate to  $V * G$ .

(d) If  $P$  is a primitive soluble subgroup of  $\text{sym}(V)$ , then there is a group  $G$  in  $S$  such that  $V * G$  is conjugate to  $P$ .

We always take  $F$  to be a finite field with  $p^k$  elements and  $n$  a positive integer.

**Theorem** (See [4], [5] & [6]) : There exists an irreducible cyclic subgroup of order  $m$  in  $GL(n, F)$  if and only if  $m$  divides  $p^k n - 1$  and  $m$  does not divide  $p^k d - 1$ , for any positive integer  $d < n$ .

**Theorem** (See [4], [5] & [6]): If there exist irreducible cyclic subgroups of order  $m$  in  $GL(n, F)$  then they lie in a single conjugacy class.

**Definition**

In  $GL(n, F)$  the irreducible cyclic subgroups of order  $p^k n - 1$  are called the signer cycles.

**Definition**

An extraspecial  $q$ -group is a finite non abelian  $q$ -group whose centre, derived group and Frattini subgroup coincide and have order  $q$ .

**Theorem:** (See [3])

Let  $G$  be an extraspecial  $q$ -group of order  $q^{1+2l}$  and exponent  $q$  or  $4$ . The group of automorphism  $S$  of  $G$  which acts trivially on both  $Z(G)$  and  $G/Z(G)$  is equal to  $\text{Inn}(G)$ . Let  $H$  be the normal subgroup of  $\text{Aut}(G)$  consisting of those elements that act trivially on  $Z(G)$ .

Then  $H/\text{Inn}(G)$  is isomorphic to a subgroup of the symplectic group  $\text{Sp}(2l, q)$ .

If  $q$  is odd, then  $H/\text{Inn}(G)$  is isomorphic to the full symplectic group  $\text{sp}(2l, q)$ . If  $G$  is the central product of  $l$  copies of  $D_8$ , then  $H/\text{Inn}(G)$  is isomorphic to the orthogonal group  $O^+(2l, 2)$ . If  $G$  is the central product of  $(l-1)$  copies of  $D_8$  and one  $Q_8$ , then  $H/\text{Inn}(G)$  is isomorphic to the orthogonal group  $O(2l, 2)$ .

Let  $G$  be the central product of a cyclic group of order  $4$  and extraspecial  $2$ -group. The group of automorphisms of  $G$  that act trivially on both  $Z(G)$  and  $G/Z(G)$  is equal to  $\text{Inn}(G)$ . If  $H$  is the normal subgroup of  $\text{Aut}(G)$  consisting of those elements that act trivially on  $Z(G)$ , then  $H/\text{Inn}(G)$  is isomorphic to the symplectic group  $\text{Sp}(2l, 2)$ .

Note that the group  $O^+(2l, 2)$  is the group of all linear transformations that preserve the quadratic form:

$f(x_1, \dots, x_{2l}) = x_1x_2 + \dots + x_{2l-1}x_{2l}$  and the group  $O(2l, 2)$  is the group of all linear transformations that preserve the quadratic form:  $f(x_1, \dots, x_{2l}) = x_1x_2 + \dots + x_{2l-1}x_{2l} + x_{2l}^2$ .

**Definition:** Let  $G$  be an irreducible subgroup of  $GL(n, F)$ , acting on the vector space  $V$ . We call  $G$  imprimitive if there exists a decomposition  $V = V_1 + \dots + V_r$  ( $r > 1$ ) of  $V$  that is preserved under the action of  $G$ .

We call the set  $\{V_1 \dots V_r\}$  a system of imprimitivity for  $G$ , and each member of this set is called a block of imprimitivity for  $G$ . The minimum of the set of dimensions of the blocks of imprimitivity for  $G$  is called the minimal block size of  $G$ . If  $G$  is not imprimitive. We call  $G$  primitive.

**Theorem E** : (see suprunenko (1976, theorem 15. 4. P.109) [11])

Let  $M$  be an Imprimitive Maximal soluble subgroup of  $GL(n, F)$ , and let  $\Omega := \{V_1 \dots V_r\}$  be an unrefinable system of imprimitivity for  $M$ . Let  $\rho : M \rightarrow \text{Sym}(\Omega)$  be the homomorphism defined by:  $\rho(g) = \rho(g)$ ,  $\forall g \in M$ ,  $V_i \rho(g) := V_i g$ . Then  $N_M(V_1)$  is a primitive maximal soluble subgroup of  $GL(V_1)$ ,  $M$  is a transitive maximal soluble subgroup of  $\text{sym}(\Omega)$ , and  $M$  is linearly isomorphic to  $N_M(V_1) \wr M$ .

**Remark:** Consider the case when  $m = n$  in the above theorem, then  $V_1$  is  $1$ -dimensional, and so  $N_M(V_1) = GL(1, F)$ , by hypothesis  $M$  is irreducible, and therefore we must have  $p^k > 2$ . In particular  $GL(n, 2)$  contains no imprimitive subgroups if  $n$  is prime.

**Theorem** (see [4]): Let  $m$  be a proper divisor of  $n$ , let  $P_m$  be a complete and irredundant set of conjugacy class representatives of the primitive maximal soluble subgroups of  $GL(m, F)$  and let  $\Omega$  be a complete and irredundant set of conjugacy class representatives of the transitive maximal soluble subgroups of  $\Omega$ . Define the set  $S_m$  of imprimitive soluble subgroups of  $GL(n, F)$  by  $S_m := \{P \wr T \mid P \in P_m, T \in \Omega\}$ .

However, if  $p^k = 2$ , then define the set  $S_1$  to be empty. Let  $S$  be the union of the  $S_m$  as  $m$  runs through the proper divisors of  $n$ . Then those members of  $S$  that are maximal soluble from a complete and irredundant set of conjugacy class representatives of the imprimitive maximal soluble subgroups of  $GL(n, F)$ .

**Theorem:** (See [13], lemma 19. 1. P.129, Theorem 20. 9, P.145). Let  $A$  be a maximal abelian normal subgroup of  $M$ . Then the following statements hold:

- $A$  is conjugate to a group of block diagonal matrices, where each block is the same, and is  $m$  by  $m$ , where  $m$  is a divisor of  $n$ ;
- The linear span  $E$ , of the powers of any one of the  $m$  by  $m$  diagonal blocks of  $A$  is an extension field of  $\text{FIm}$ .
- The degree of this field extension is  $m$ .

- A is isomorphic to the multiplicative group of E: in particular, A is cyclic of order  $pkm-1$ .
- A is the unique maximal abelian normal subgroup of M.

Notation: Define the map  $\square: NL(F) \square GL(2l, q)$  by

Where: Theorem (See to [4], [5] & [6]):

Let  $n = qlm$ . Where  $l > 0$ , and  $q$  is a prime divisor of  $pkm-1$ . If  $q = 2$ , then suppose in addition that  $pkm \equiv 1 \pmod{4}$ . Let  $z_1$  be our fixed generator of a singer cycle of  $GL(m, F)$ , and let  $a_1$  be our fixed element of order  $m$  in  $GL(m, F)$  such that  $\dots$ . Let  $a, z$  be the  $n$  by  $n$  block diagonal matrices with  $a_1$  and  $z_1$  running down their diagonals, respectively. Define the matrices  $u_i$  and  $v_i$  as Notatin 2.13. Let  $S$  be the subgroup of  $GL(2l, q)$  That is generated by  $Sp(2l, q)$  and the block diagonal matrix with the matrix  $\dots$  running down its diagonal. Let  $D$  be a completely reducible (not necessarily maximal) soluble subgroup of  $S$  which does not fix any non-zero isotropic subspace of the natural module for  $Sp(2l, q)$ .

Suppose  $D$  has generating set  $\{d_1, \dots, d_r\}$ . If  $d_i$  is the matrix then  $g_i$  be any matrix of  $GL(n, F)$  statysing for some (arbitrary) integer  $\square_j$  and  $\square_j$ . let  $P$  the subgroup of  $GL(n, F)$  defined by:  $P := \langle G \langle a \rangle \langle v_1, \dots, v_l \rangle, g_1, \dots, g_r, u_1, v_1, \dots, u_l, v_l, z \rangle$  then  $P$  is the complete inverse image of  $D$  under  $r$ . Furthermore,  $P$  is primitive and has a maximal abelian normal subgroup of order  $pkm-1$ . Now let  $D_1$  be a complete and irredundant set of  $S$  – conjugacy class representatives of the completely reducible maximal soluble subgroup of  $S$  which do not fix any non-zero isotropic subspace of the natural module for  $sp(2l, q)$ . Let  $P_1$  be the set of groups  $P$  obtained by the above method, one for each  $D$ , where  $D$  runs through the members of  $D_1$ . No two members of  $P$  are conjugate in  $GL(n, F)$ . If  $M$  is a primitive maximal soluble subgroup of  $GL(n, F)$  whose unique maximal abelian normal subgroup has order  $pkm-1$ , then  $M$  is conjugate to a member of  $P_1$ .

Theorem: Let  $n = 2lm$ , and suppose that  $pkm \equiv 3 \pmod{4}$ . Let  $z$  be our fixed generator of a singer cycle of  $GL(m, F)$ , and let  $a_1$  be our fined element of order  $m$  in  $GL(m, F)$  such that  $\dots$ . Let  $a$  and  $z$  be the  $n$  by  $n$  block diagonal matriees with  $a_1$  and  $z_1$  running down their diagonals, respectively For  $1 \leq i \leq l-1$  define the matrices  $u_i$  and  $v_i$  as notation 2.13.

Define  $u_{l+}$  and  $v_{l+}$  by:  $\dots$  and definee.  $u_{l-}$  and  $v_{l-}$  by  $\dots$  Where  $\square$  and  $\square$  are two elements of  $Flm$  such that  $\square^2 + \square^2 = -Im$ . Let  $D$  be a completely reducible (not necessarily maximal) soluble subgroup of  $O+(2l, 2)$  or  $O-(2l, 2)$  which does not fix any non-zero isotropic subspace of the natural module for the relevant orthogonal group. Suppose  $D$  has generating set  $\{d_1, \dots, d_r\}$ . If  $d_i$  is the matrix Then let  $g_i$  be any matrix of  $GL(n, F)$  statysing for some (arbitrary) integers  $\square_j$  and  $\square_j$ , and where the superscript  $*$  is replaced by  $+$  or  $-$

according as  $D$  belongs to  $O+(2l, 2)$  or  $O-(2l, 2)$ , respectively, let  $P$  be the subgroup of  $GL(n, F)$  defined by  $P := \langle C \langle a \rangle \langle v_1, \dots, v_l \rangle, g_1, \dots, g_r, u_1, v_1, \dots, u_l, v_l, z \rangle$  then  $P$  is the complete inverse image of  $D$  under  $r$ . Furthermore,  $P$  is primitive and has a maximal abelian normal subgroup of order  $pkm-1$ . now let  $D_+$  be a complete and irredundant set of  $O+(2l, 2)$ - conjugacy class representatives of the completely reducible maximal soluble subgroups of  $O+(2l, 2)$  which do not fix any non-zero isotropic subspace of the natural module for  $O+(2l, 2)$ .

Define  $D_-$  similarly, with  $O-(2l, 2)$  in place of  $O+(2l, 2)$ , let  $P_1$  be the set of groups  $P$  obtained by the above method, one for each  $D$ , where  $D$  runs through the members of  $D_+$  and  $D_-$ . No two members of  $P_1$  are conjugate in  $GL(n, F)$ . If  $M$  is a primitive maximal soluble subgroup of  $GL(n, F)$  whose unique maximal abelian normal subgroup has order  $pkm-1$ . Then  $M$  is conjugate to a member of  $P_1$ .

Proof: The proof of this theorem goes exactly the similar with the proof previous theorem and the reader can be referred to [4] & [5].

Definition: Any group constructed by the methods theorems 2.11, 2.14 and 2.15 will be called a JS-maximal (for jordan-suprunenko) of  $GL(n, F)$ . we will also use the terms JS-imprimitive and JS-primitive to denote imprimitive and primitive JS-maximal, respectively. Note that every JS-maximal is irreducible and soluble. but not necessarily maximal soluble. The smallest value of  $pkn$  for which there are JS-maximals and are not maximal soluble is 9. (see [11]).

Remark: For the imprimitives we use  $P$  wr  $T$  where  $P$  and  $T$  are as described in Theorem A and For the primitives, we use  $(Y E)N D$  where  $E$  is extraspeical of order  $q_1+2l$  and exponent  $q$  or 4, and  $D$  is as described in theorem B or C. Of course, there may be many (pairwise non-isomorphic) groups with than a normal subgroup isomorphic to  $Y E$  whose quotient is isomorphic to  $D$ . But we always mean the one obtained by the construction methods in this paper.

Definition: Let the JS-maximal  $S$  of  $GL(n, F)$  be  $M_1, \dots, M_m$  and let  $G$  be an irreducible soluble subgroup of  $GL(n, F)$ . If  $n$  is prime and  $G$  is cyclic, then we define the guardian of  $G$  to be that JS-maximal which is the normaliser of a singer cycle. Otherwise the gurdian of  $G$  is defined to be  $M_i$ , where  $i$  is the least positive interger such that  $G$  is  $GL(n, F)$ -conjugate to a subgroup of  $M_i$ .

In this Section by using previous theorems and methods of Section 1 and section 2, We determine The irreducible Soluble Subgroups of  $GL(4, pk)$ . For this we proof the following main theorem.

Theorem: Let  $p$  be a prime number and  $k, n$  be positive integers and let  $F$  be the field of  $pk$  elements. Then the number of types of The irreducible Soluble Subgroups in the group  $GL(4, pk)$  is 10.

Proof: By definition 2.16 since every JS-maximal is irreducible and Soluble, therefore, we suffices to determine the JS-maximal soluble subgroups of the  $GL(4, pk)$ . For this purpose, let  $F$  be the field of  $pk$  elements. Since both  $GL(1, F)$  and  $S_2$  are Soluble, therefore by theorem (2.11) and remark (2.17) there is exactly one Js-imperative soluble subgroup of  $GL(2, F)$ , namely,  $M1(2, pk) = GL(1, pk) \text{ wr } S_2$ ,  $pk \not\equiv 2$  Also since the unique maximal abelian normal subgroup of the group  $GL(2, pk)$  order  $p^{2k-1}$  or  $pk-1$ , then by theorems 2.14, 2.15 and remark 2.17 the JS-Primitive group of order  $p^{2k-1}$  and  $pk-1$ , as follows:  $M2(2, pk) = * C_2$ ,  $M3(2, pk) = (Y Q_8) N O(2, 2)$ ,  $pk \equiv 3 \pmod{4}$   $M4(2, pk) = (Y Q_8) N Sp(2, 2)$ ,  $pk \equiv 1 \pmod{4}$

Therefore by used from JS - maximals  $GL(2, pk)$ , the JS-imprimitives of  $GL(4, pk)$  listed as follows.

$$\begin{aligned} M1(4, pk) &= GL(1, pk) \text{ wr } S_4, \\ M2(4, pk) &= M2(2, pk) \text{ wr } S_2, \\ M3(4, pk) &= M3(2, pk) \text{ wr } S_2, \quad pk \equiv 3 \pmod{4}, \\ M4(4, pk) &= M4(2, pk) \text{ wr } S_2, \quad pk \equiv 1 \pmod{4}, \end{aligned}$$

And also The JS - primitive of  $GL(4, pk)$  are listed below:

$$\begin{aligned} M5(4, pk) &= * C_4, \\ M6(4, pk) &= M2(2, pk) * C_2, \quad pk \equiv 2, \\ M7(4, pk) &= Y D_8 Y Q_8 N O(4, 2), \quad pk \equiv 3 \pmod{4}, \\ M8(4, pk) &= Y D_8 Y Q_8 N HOL(C_5), \quad pk \equiv 3 \pmod{4}, \\ M9(4, pk) &= Y D_8 Y Q_8 N O(4, 2), \quad pk \equiv 1 \pmod{4}, \\ M10(4, pk) &= Y D_8 Y Q_8 N HOL(C_5), \quad pk \equiv 1 \pmod{4}. \end{aligned}$$
